

ABSTRACT OF THE DISCLOSURE

A system and method of displaying information onto a plurality of display screens. The system includes a computing system which formats information inputted by an operator. The information is formatted as data packets which include an identification tag designating the ultimate destination of the data packet, as selected by the operator. The system also includes a switch box and a plurality of projection units. Each projection unit displays images onto an associated display screen. The switch box receives the data packets from the computing system and determines the appropriate destination. The switch box then sends each data packet to the designated projection unit for display onto its corresponding display screen. The presentation system enables one operator to present data on a plurality of screens through the use of a single computing system.
